

Legend for the Organized Change Log:

\*1 - When the cell in the TX column (transaction) is greyed out and **Review/Response** are Bolded - the change applies to both the Review related loop-segment and the Response related loop segment

Explanatory Note:

The changes to the 8010v of this transaction are, for the most part, refinements to code values and usage requirements.

#1 – 6 are specifically called out because:

- a.) the functions are likely to be increasingly important to the usage of the transaction (#1 – Attachments, #2 – BHT / HL),
- b.) the functions represent a new usage of the transaction (#5 – Drug Auth, #6 – Workman’s Compensation) or
- c.) there are numerous listed changes within a segment(s) (#3 – CR/CRC & #4 - Diagnosis) - – though not all may be relevant.

The remainder of the changes, which are the bulk of the document, are listed in the “278-342 Organized Change Log” as ‘Clarify Usage – Misc’

**1. Attachments**

The 8010v attachment changes are primarily related to the use of the PWK, i.e. new Code Value of ‘FT-File Transfer’ and new segment note.

Though these changes are few, they are highlighted due to the likely importance of this transaction and the 275 -Attachments transaction by the time that the new version is mandated.

**2. BHT / HL Segment**

The 8010v BHT/HL Segment changes primarily relate to:

- Removing “AT” code value of BHT02 so as to be explicit about whether or not follow-on responses are to be expected.
- Outlining situational usage requirements, depending upon the value of UM01 & UM03
- Providing instructions for how to order the HL segments

### **3. CR / CRC Segment**

The 8010v CR / CRC Segment changes primarily relate to:

- Using new / different code values to be more specific about the condition being reported
- Deleting code values because they do not relate to the condition being reported
- Being more specific about the conditions under which usage of the segment /data element is required

### **4. Diagnosis (HI Segment)**

The 8010v Diagnosis changes primarily relate to :

- Adding a segment to provide additional diagnosis information to clarify services, rather than sending with MSG segment.
- Restricting the use of MSG segments for diagnosis code information
- Specifying conditions under which usage of the segments are required

### **5. Drug Auth (DRA Segment)**

The 8010v Drug Auth changes primarily relate to:

- Adding a segment (since the 5010) to the 2000F loop to specify the drug for which authorization is being requested
- Using new / different code values (likely relating to the difference between 6020 and 7030)
- Specifying changes to conditions under which usage of the segments are required (likely relating to the difference between 6020 and 7030)

### **6. Workman's Compensation**

The 8010v Workman's Comp changes primarily relate to using the transaction for Workman's Compensation exchanges where there is a case number rather than a patient number that uniquely identifies a patient and their coverage plan. In these cases, the subscriber type is a non-person entity (NM102='2'), the TIN of the agency will be used (NM108='FI') and the case number for the subscriber / dependent will be used to identify the patient (REF01='Y4').
